

IN THE CLAIMS

For the convenience of the Examiner, all pending claims of the Application are reproduced below.

1. **(Original)** A method for providing a general purpose computing platform at a router on a network, comprising:
 configuring a virtual machine on a router with a plurality of parameters;
 receiving logic from a remote site at the virtual machine; and
 verifying that the virtual machine may host the logic based on the parameters created during configuration.
2. **(Original)** The method of Claim 1, wherein configuring the virtual machine on the router with the parameters comprises allocating a processing resource operable to execute the logic on the virtual machine.
3. **(Original)** The method of Claim 1, wherein:
 configuring the virtual machine on the router with the parameters comprises allocating a processing resource operable to execute the logic on the virtual machine; and
 verifying that the virtual machine may host the logic based on the parameters created during configuration comprises determining whether the processing resource is available to execute the logic.
4. **(Original)** The method of Claim 1, wherein configuring the virtual machine on the router with the parameters comprises assigning a plurality of authorized credentials to the virtual machine.

5. **(Original)** The method of Claim 1, wherein:

configuring the virtual machine on the router with the parameters comprises assigning a plurality of authorized credentials to the virtual machine;

receiving the logic from the remote site at the virtual machine comprises determining an address associated with the remote site; and

verifying that the virtual machine may host the logic based on the parameters created during configuration comprises:

retrieving logic credentials for the logic from the remote site using the determined address; and

comparing the authorized credentials with the logic credentials.

6. **(Original)** The method of Claim 1, wherein configuring the virtual machine on the router with the parameters comprises provisioning a first lifecycle policy for the virtual machine.

7. **(Original)** The method of Claim 1, wherein:

configuring the virtual machine on the router with the parameters comprises provisioning a first lifecycle policy for the virtual machine;

receiving the logic from the remote site at the virtual machine comprises determining an address associated with the remote site; and

verifying that the virtual machine may host the logic based on the parameters created during configuration comprises:

retrieving a second lifecycle policy for the logic from the remote site using the determined address; and

altering the first lifecycle policy if the second lifecycle policy includes different constraints than the first lifecycle policy.

8. **(Original)** The method of Claim 1, wherein receiving the logic from the remote site at the virtual machine comprises:

determining an address associated with the remote site; and

retrieving a manifest for the logic from the remote site using the determined address, the manifest including a configurable object needed to execute the logic on the virtual machine.

9. **(Original)** The method of Claim 1, wherein:

configuring the virtual machine on the router with the parameters comprises provisioning a first lifecycle policy for the virtual machine;

receiving the logic from the remote site at the virtual machine comprises:

determining an address associated with the remote site; and

retrieving a manifest for the logic from the remote site using the determined address, the manifest including a configurable object needed to execute the logic on the virtual machine; and

verifying that the virtual machine may host the logic based on the parameters created during configuration comprises:

retrieving a second lifecycle policy for the logic from the remote site using the determined address; and

updating the logic if the second lifecycle policy includes a new version of the configurable object.

10. **(Original)** The method of Claim 1, wherein the virtual machine comprises a virtual interface including an address.

11. **(Original)** The method of Claim 1, wherein the virtual machine comprises a virtual service including a plurality of addresses.

12. **(Original)** The method of Claim 1 further comprising:
loading default configuration parameters for the router; and
receiving a provisioning message to configure the virtual machine on the router.

13. **(Withdrawn)** A method for providing a general purpose computing platform at a router on a network, comprising:
configuring a virtual machine on a router with a plurality of parameters, the parameters including a plurality of authorized credentials;
determining an address associated with a remote site;
retrieving logic and logic credentials from the remote site using the determined address; and
comparing the authorized credentials with the logic credentials to verify that the virtual machine may host the logic.

14. **(Withdrawn)** The method of Claim 13, wherein the parameters include a processing resource allocated to execute the logic on the virtual machine and further comprising determining whether the processing resource is available to execute the logic to verify that the virtual machine may host the logic.

15. **(Withdrawn)** The method of Claim 13, wherein the parameters include a first lifecycle policy and further comprising:
determining an address associated with the remote site;
retrieving a second lifecycle policy for the logic from the remote site using the determined address; and
updating a version of the logic on the virtual machine based on the second lifecycle policy.

16. **(Withdrawn)** The method of Claim 13, wherein the parameters include a first lifecycle policy and further comprising:

determining an address associated with the remote site;

retrieving a second lifecycle policy for the logic from the remote site using the determined address; and

determining if the logic on the virtual machine is accessible by a remote service based on the second lifecycle policy.

17. **(Withdrawn)** The method of Claim 13, wherein the parameters include a first lifecycle policy and further comprising:

determining an address associated with the remote site;

retrieving a second lifecycle policy for the logic from the remote site using the determined address; and

executing the logic on the virtual machine based on usage criteria in the second lifecycle policy.

18. **(Withdrawn)** A router comprising:

a processor; and

a virtual machine coupled to the processor, the virtual machine configured to host logic acquired from a remote site and operable to verify whether the processor may execute the acquired logic.

19. **(Withdrawn)** The router of Claim 18, wherein the virtual machine is further operable to generate a plurality of authorized credentials.

20. **(Withdrawn)** The router of Claim 18, wherein the virtual machine is further operable to:

- generate a plurality of authorized credentials;
- retrieve logic credentials for the logic by determining an address associated with the remote site; and
- compare the logic credentials with the authorized credentials to verify that the processor may execute the acquired logic.

21. **(Withdrawn)** The router of Claim 18, further comprising the virtual machine operable to allocate the processor to execute the logic.

22. **(Withdrawn)** The router of Claim 18, wherein the virtual machine is further operable to:

- allocate the processor to execute the logic; and
- determine if the processor is available to execute the logic.

23. **(Withdrawn)** The router of Claim 18, wherein the virtual machine is further operable to:

- provision a first lifecycle policy;
- retrieve a second lifecycle policy for the logic by determining an address associated with the remote site; and
- alter the first lifecycle policy if the second lifecycle policy includes different constraints than the first lifecycle policy.

24. **(Withdrawn)** The router of Claim 18, wherein the virtual machine is further operable to:

- provision a first lifecycle policy;
- retrieve a second lifecycle policy for the logic by determining an address associated with the remote site; and
- update a version of the logic based on the second lifecycle policy.

25. **(Withdrawn)** The router of Claim 18, wherein the virtual interface is further operable to:

- provision a first lifecycle policy;
- retrieve a second lifecycle policy for the acquired logic by determining an address associated with the remote site; and
- execute the logic based on usage criteria included in the second lifecycle policy.

26. **(Withdrawn)** The router of Claim 18, wherein the virtual interface is further operable to:

- provision a first lifecycle policy;
- retrieve a second lifecycle policy for the acquired logic by determining an address associated with the remote site; and
- determine if the logic is accessible by a remote service based on the second lifecycle policy.

27. **(Withdrawn)** The router of Claim 18, wherein the virtual machine is further operable to:

- provision a first lifecycle policy;
- retrieve a second lifecycle policy for the acquired logic by determining an address associated with the remote site;
- retrieve a manifest for the logic based on the address, the manifest including a configurable object needed to execute the logic on the virtual machine; and
- update the logic if the second lifecycle policy includes a new version of the configurable object.

28. **(Withdrawn)** The router of Claim 18, wherein the virtual machine comprises a virtual interface including an address.

29. **(Withdrawn)** The router of Claim 18, wherein the virtual machine comprises a virtual service accessible from one or more addresses.

30. **(Original)** Logic encoded in media for providing a general purpose computing platform at a router on network, the logic operable to perform the following steps:
configuring a virtual machine on a router with a plurality of parameters;
receiving logic from a remote site at the virtual machine; and
verifying that the virtual machine may host the logic based on the parameters created during configuration.

31. **(Original)** The logic of Claim 30, further comprising:
allocating a processing resource operable to execute the logic on the virtual machine;
and
determining whether the processing resource is available to execute the logic.

32. **(Original)** The logic of Claim 30, further comprising:
assigning a plurality of authorized credentials to the virtual machine;
determining an address associated with the remote site;
retrieving logic credentials for the logic from the remote site based on the determined address; and
comparing the authorized credentials with the logic credentials.

33. **(Original)** The logic of Claim 30, further comprising:
provisioning a first lifecycle policy for the virtual machine;
determining an address associated with the remote site;
retrieving a second lifecycle policy for the logic from the remote site based on the determine address; and
updating a version of the logic on the virtual machine based the second lifecycle policy.

34. **(Original)** The logic of Claim 30, further comprising:
provisioning a first lifecycle policy for the virtual machine;
determining an address associated with the remote site;
retrieving a second lifecycle policy for the logic from the remote site based on the determined address; and

executing the logic based on usage criteria included in the second lifecycle policy.

35. **(Original)** The logic of Claim 30, further comprising:
provisioning a first lifecycle policy for the virtual machine;
determining an address associated with the remote site;
retrieving a second lifecycle policy for the logic from the remote site based on the determined address; and

determining if the logic on the virtual machine is accessible by a remote service based on the second lifecycle policy.

36. **(Original)** The logic of Claim 30, further comprising:
provisioning a first lifecycle policy for the virtual machine;
determining an address associated with the remote site;
retrieving a second lifecycle policy for the logic from the remote site based on the determined address;

receiving a manifest for the logic from the remote logic; and

updating the logic if the second lifecycle policy includes a new version of a configurable object.

37. **(Original)** An apparatus for providing a general purpose computing platform at a router on a network, comprising:

means for configuring a virtual machine on a router with a plurality of parameters;

means for receiving logic from a remote site at the virtual machine; and

means for verifying that the virtual machine may host the logic based on the parameters created during configuration.

38. **(Original)** The apparatus of Claim 37, further comprising:
means for assigning a plurality of authorized credentials to the virtual machine;
means for determining an address associated with the remote site;
means for retrieving logic credentials for the logic from the remote site based on the determined address; and
means for comparing the authorized credentials with the logic credentials.

39. **(Original)** The apparatus of Claim 37, further comprising:
means for allocating a processing resource operable to execute the logic on the virtual machine; and
means for determining whether the processing resource is available to execute the logic.

40. **(New)** A method for providing a general purpose computing platform at a router on a network, comprising:
configuring a virtual machine on a router with a plurality of parameters;
receiving logic to execute a desired service from a remote site at the virtual machine;
and
verifying that the virtual machine may host the logic based on the parameters created during configuration.

41. **(New)** The method of Claim 40, wherein receiving the logic to execute a desired service from the remote site at the virtual machine comprises:
determining an address associated with the remote site; and
retrieving a manifest for the logic from the remote site using the determined address, the manifest including a configurable object needed to execute the logic on the virtual machine.
